

Model Changes

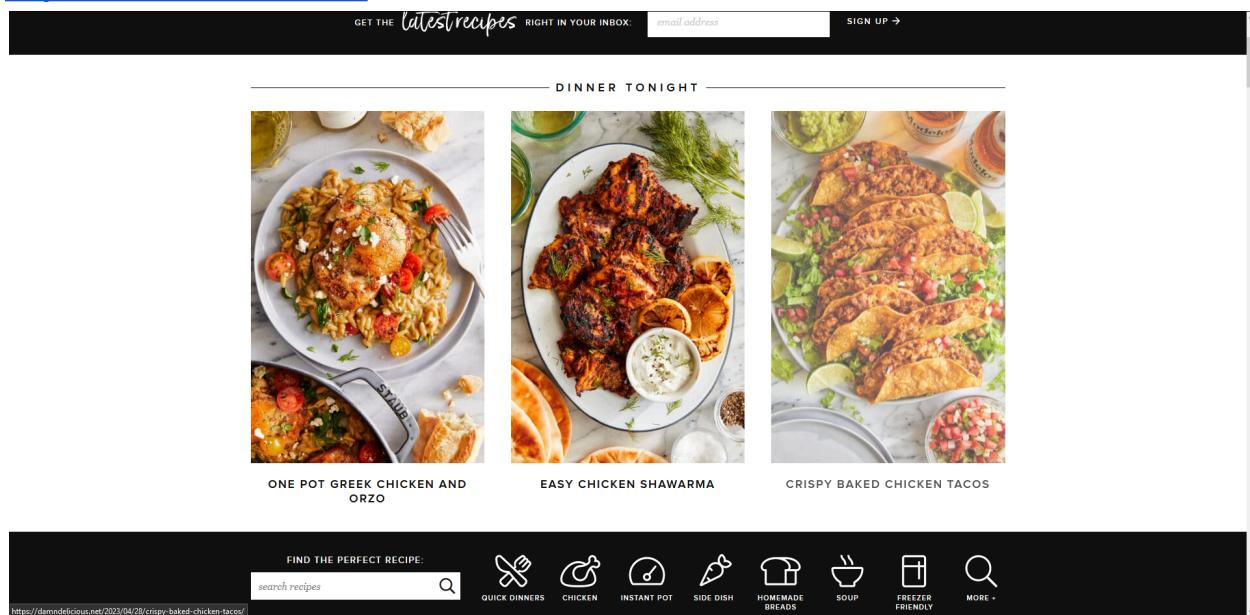

My previously established model had all the fields necessary for the backend of the application, but as the frontend begins to demand more attention, a small tweak to the recipe model needs to be made. The recipe app should include images of the recipes being added, so I need to add an image attribute that allows user generated images to be displayed.

Additionally, in order to supply the links in the full list view with an actual URL to visit, I've had to create the `get_primary_url` method, which properly links up a clickable link with a URL based on a recipe's primary key and allows the app to redirect the user to a details page with information specific to that recipe.

Recipe App Frontend - Inspirations

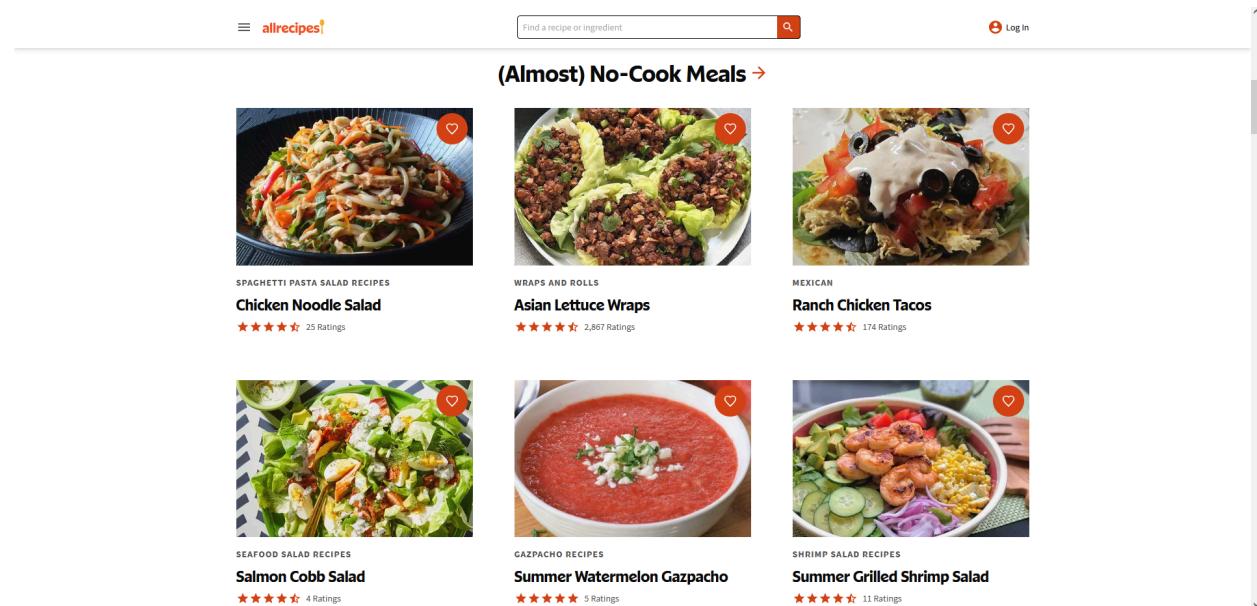

Moving forward with the app's development, I will be adjusting the visual presentation of the web app in order to be more appealing. Below I've included reference images that serve as inspirations that influenced my design decisions and overall look of the app.

<https://damndelicious.net/>

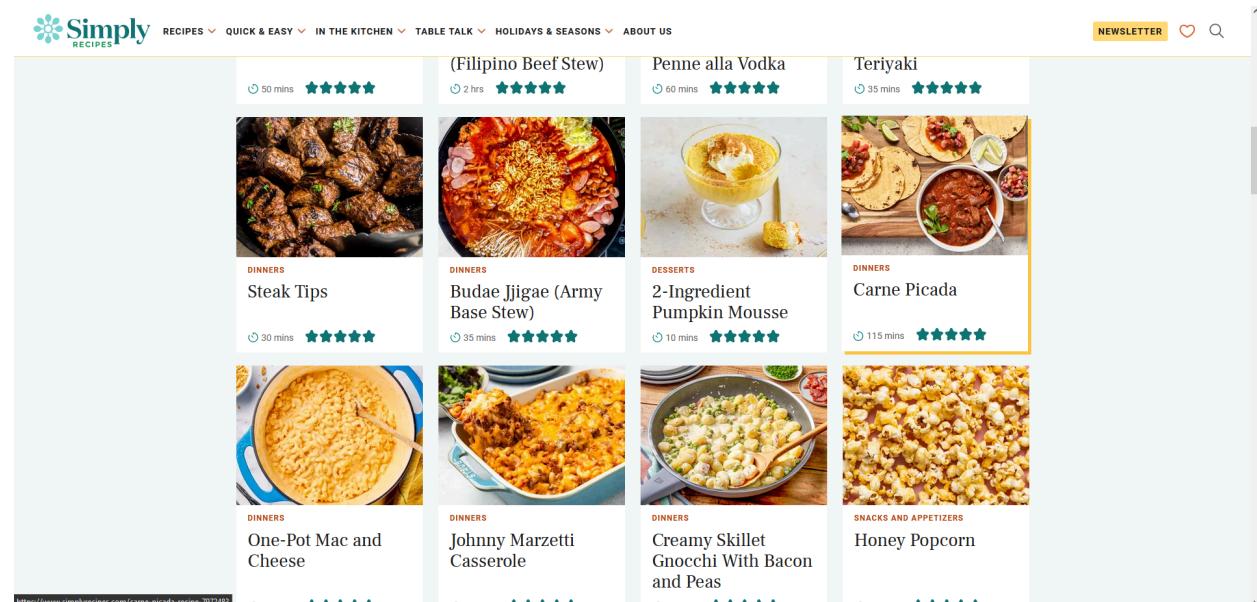

I appreciate the consistency that this website has. All of their pictures have a very clear standard they abide by, giving a distinct sense of cohesion to the site. I'm not sure how possible it would be for my own app to achieve that, but I did think it best to point out and keep in mind. The rest of the site is also somewhat minimalistic in its graphical design, delivering what the user needs in a quick and easily legible manner.

I particularly enjoy the color scheme and layout of this one. There's just enough color to give the site a subtle and enjoyable flair. The simple grid layout is also rather effective for what it sets out to do, and feels like something I will particularly want to replicate.

Again, this site makes use of a simple yet effective grid layout, and definitely makes use of a nice color palette to give an extra layer of flair to its presentation. What particularly draws me in is its display of cooking times; being able to easily see that feels like functionality I will want to replicate in my own app.
